

CHIRANJEEV TRIPATHI

Computer Science Undergraduate | Data Analytics & Machine Learning Enthusiast

Bhopal, India | +91-9406775006 | chiranjeevtripathi2204@gmail.com | linkedin.com/in/chiranjeev-tripathi | github.com/chiranjeev

Professional Summary

Computer Science undergraduate with over a year of hands-on data analytics experience, cleaning and transforming **100+ real-world datasets** across **10+ Power BI dashboard projects** using Python, SQL, and DAX. Applied machine learning experience using Random Forest to forecast customer churn and drive data-informed decisions.

Education

Bachelor of Technology (B.Tech), Computer Science and Engineering **2023 – Present (Expected 2027)**
VIT Bhopal University *CGPA: 8.82 / 10*

Core Skills

Programming: Java, Python, SQL

Data Analytics: SQL, Microsoft Excel, Power BI, Power Query, DAX, Data Cleaning & Transformation, Exploratory Data Analysis, ETL, Data Modeling, KPI Development, Window Functions, CTEs, Statistical Analysis

Machine Learning, Cloud & Tools: Scikit-learn, Predictive Modeling (Classification, Regression), AWS (S3, EC2, RDS, Glue, Athena, QuickSight), MySQL, SQL Server, Git, GitHub

Projects

Vendor Performance Analytics Dashboard | *Python, SQL Server, Power BI, Excel, DAX*

- **Problem:** Vendor and inventory records were split across 6 disconnected sources, making it hard to see vendor performance, stock movement, and margin leakage in one place.
- Consolidated and validated 6 source files (Sales, Purchases, Purchase Prices, Vendor Invoices, Beginning/Ending Inventory) spanning **136 vendors** and 5,000 SKUs using Python and Excel.
- Engineered **5 SQL Server views** (vendor-, store-, monthly-, and brand-level revenue) and 5 custom DAX measures, powering two Power BI dashboards with 9 KPI cards and 9 interactive visuals.
- Tracked **\$64.98M** in total revenue across 2,884 orders and 258K units sold, plus \$313.83M in ending inventory value across 5,000 SKUs, giving stakeholders a single view for vendor and stock decisions.

Customer Churn Analysis & Prediction | *Python, SQL Server, Power BI, Excel, Random Forest*

- **Problem:** The business had no early signal for at-risk customers, so retention outreach happened only after a customer had already churned.
- Cleaned and modeled **6,418** customer records (34 attributes) in Excel and SQL Server using joins and views, feeding a two-page Power BI reporting layer.
- Designed 5 DAX measures (Churn Rate, Total Churn, New Joiners, Total Customers, Predicted Churners) to track a **26.99%** churn rate across 1,732 churned and 411 newly joined customers.
- Trained a Random Forest classifier in Python and applied it to active customers, flagging **372** as high churn-risk on a dedicated predictive-analysis dashboard page for proactive retention outreach.

Banking Dataset Analysis | *SQL Server, Power BI, Excel, DAX, Generative AI*

- **Problem:** Customer, account, and transaction records existed as a single unstructured export, making it hard to see account activity and balance trends over time.
- Structured and transformed **10,000** transactions across 4 accounts using Excel, SQL Server, and Power Query to produce an analysis-ready table.
- Developed 6 DAX measures (Total Balance, Count of Transactions, Inactive Accounts, Monthly Transactions Balance) powering a two-page Power BI report with 12 visuals.
- Tracked account activity by type (Current vs. Savings) and an even **50/50** split between debit and credit transaction volume, with balance trends visualized by month.
- Used ChatGPT, Claude, and Perplexity to draft SQL/DAX, generate the synthetic dataset, and assist documentation, manually validating every query and measure against source data before use.

Certifications

- **Data Analyst Complete Beginner to Advanced Bootcamp** – Udemy
- **Generative AI for Data Analytics** – Simplilearn
- **Introduction to Machine Learning** – NPTEL
- **AWS Cloud Practitioner** – AWS SkillBuilder
